

How to Install

No. 138 WATER TOWER

This realistic water tower is made for use with both 'O' and '027' layouts. It can be located anywhere on the track, but a natural place for it is near a station, where the locomotive would normally stop to take on water.

The water tower is connected to a No. 96C push-button controller and to any pair of transformer binding posts furnishing from 10 to 14 volts. The clips for wire connections are underneath the tower base.

To operate the water tower, move the locomotive tender under the water spout and press the controller button. The spout will drop down to horizontal position as if to fill the water tank in the tender. Release the button and the water spout will rise.

SERVICE INFORMATION

This water tower was inspected at the Factory and is in perfect operating condition. Like all Lionel products it is guaranteed against defects in material and workmanship to the extent that if any such tower is returned to The Lionel Corporation or any of its Authorized Service Stations within one year from the date of purchase it will be repaired or replaced. If in the future it should ever

require servicing, you may either return it to the Factory Service Department, or take it to your nearest Lionel Approved Service Man in your district.

If you decide to mail the tower to us, be sure to pack carefully to avoid damage in transit. Use the original box, if possible, and enclose in another corrugated box or strong container. A letter in a stamped envelope stating fully the service desired must be pasted to the outside wrapper. Post Office regulations do not permit any written matter to be placed inside packages.
